1. Welcome to Any Video Converter

Any Video Converter is an All-in-One video converting tool with easy-to-use graphical interface, fast converting speed and excellent video quality. It allows you to effortlessly convert video files between popular format! It can convert almost all video formats including DivX, XviD, MOV, rm, rmvb, MPEG, VOB, DVD, WMV, AVI to MPEG-4 movie format for smart phone, FLV, AVI and MPEG-1, MPEG-2. **It also supports importing video clips directly from YouTube.**

1.1 Main Window of Any Video Converter

The main window of Any Video Converter is illustrated as follows:

The main window of the program is divided into *four parts*:

--The *left window* is the files panel of the program.

* Source Files: Click it to see all videos you add to the program.

* Converted: Files with same output profile are put in the same folder and you can approach them directly.

* Downloaded: The folder containing videos you have downloaded from YouTube and Google.

--The *middle window* displays all videos you add and all videos which have been converted.

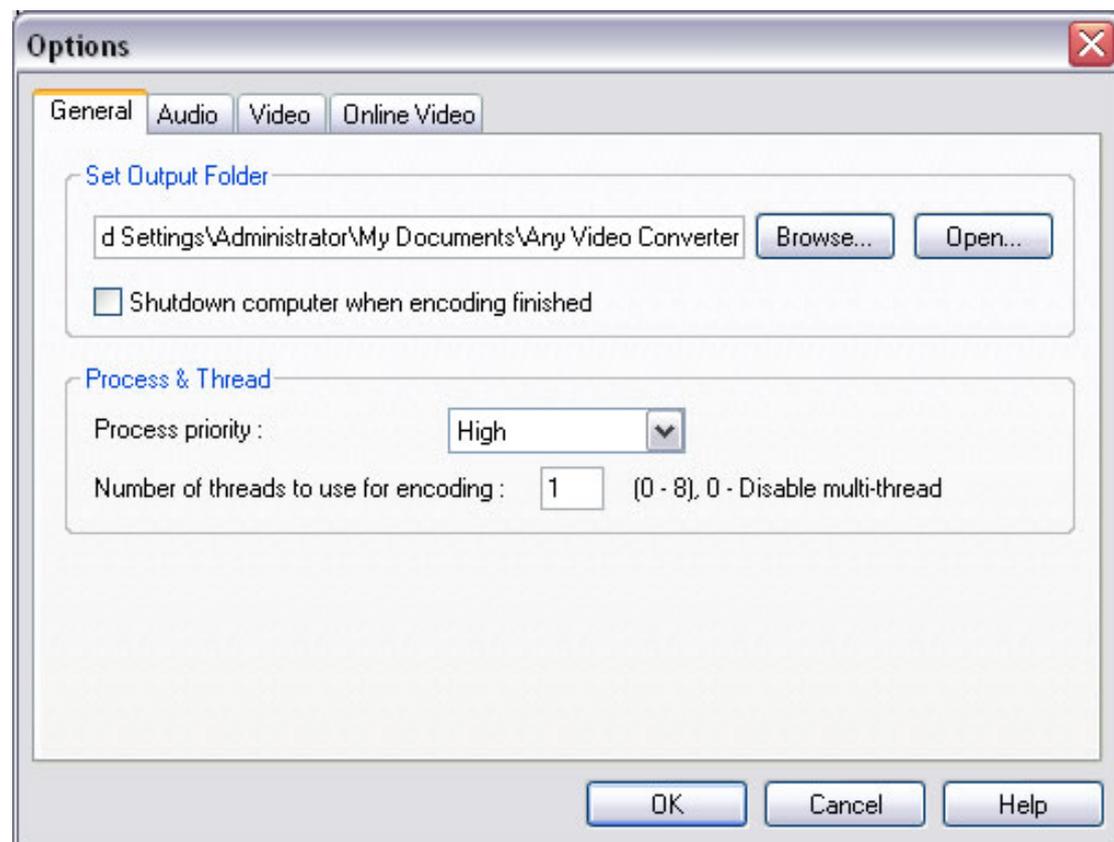

--The *upper left window* is for previewing the trimming added videos.

--The *lower left window* shows all setting of the profile you select, You can also customize output profile here.

1.2 Setting Program Options

You can make other relevant settings such as audio volume, video parameters, in the Options window of the program. Click the **Options** button in the left bottom of the main window, and you will see the Options window as the following:

There are five tabs in the Options window. In each tab, you can make different setting as follows:

General

--The output folder can also be set and opened here. Click the Browse button to change the location, while click the Open button to open the output folder.

--You can choose the number of threads you use to encode the video. The more threads you use, the more CPU the program will use to convert the video.

Audio

--You can adjust the audio volume in the converted files

--AAC and MP3 parameters can also be selected according to your requirements.

Normally, the default settings are recommended to use.

Video

--You can resize the video by only fitting its width or height.

Online Video

--You may log in your YouTube account here

--The number of retries means how many times the program tries to download the video from YouTube and Google when having download problems

--Checking Use system internal cache when downloading can make the download quicker

DVD

--Check Don't separate a DVD video disc as titles option to prevent the program adding the DVD movie as separated titles.

1.3 Converting Videos to Any Output Formats

With Any Video Converter, you can convert your videos to any output formats within three steps:

Step One:

Add videos and then trim added videos as you like.

Step Two:

Choose output profile and set technical parameters for output videos. Generally, default settings are recommended to use.

Step Three:

Start converting videos by clicking the **Encode** button.

1.4 Supportable Formats

Supportable Input Formats: WMV, ASF, VOB, MPG, DV, M1V, M2V, MOV, MPEG-4, 3GP, RM, RMVB, AVI, FLV.

Supportable Output Formats: AVI, FLV, WMV, MPEG-1, MPEG-2, MPEG-4.

1.5 Upgrading to Professional Version

If you would like to convert videos playable on your iPod, PSP and Zune or extract MP3 audio from videos, you may upgrade to the professional version of Any Video Converter.

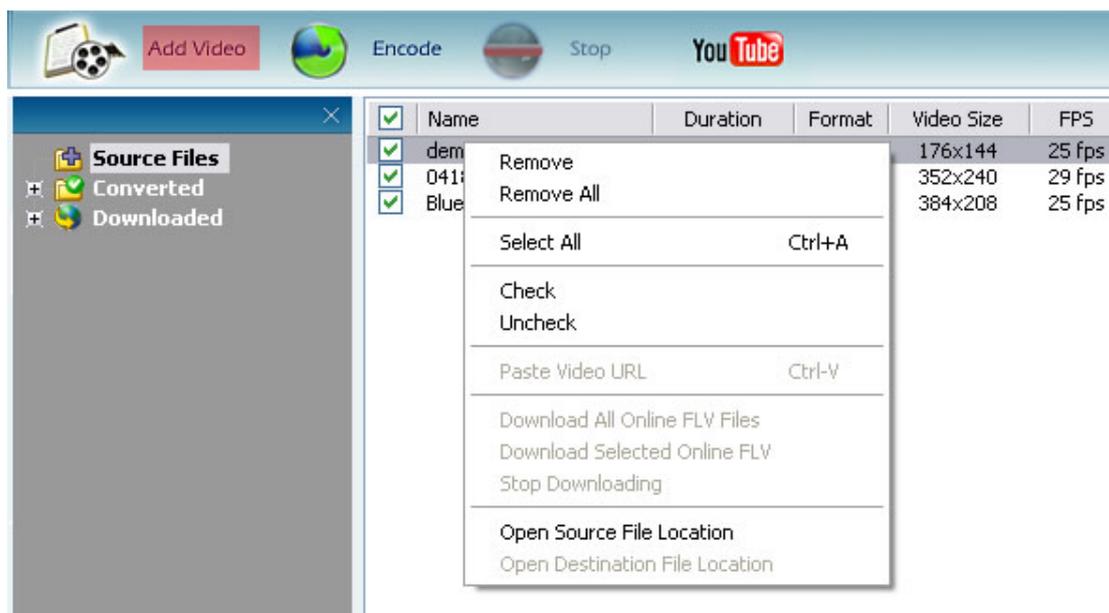

Run Any Video Converter and choose **Help > Upgrade to Professional Version**. After you place an order of the pro version, you will receive the code for pro version as soon as possible.

2. Adding Videos from Different Sources

With Any Video Converter, you can add videos by selecting videos saved on your hard drive, downloading videos from YouTube and Google, and even capturing videos from your DV.

--Delete Videos

If you want to delete added videos, right-click on the selected video and you will see a pop-up and then choose **Remove** to delete selected clip and choose **Remove All** to delete all added videos.

2.1 Adding Videos from Hard Drive

Click **Add Video** button to select your desired video clips from your hard drive. Press **Ctrl** or **Shift** to select more than one video at one time in file folder. After you add desired videos, all of them will be displayed on the left upper panel with their detailed information, including duration, format and size, etc.

2.2 Downloading Videos from YouTube and Google

With the program, you can download videos from YouTube and then convert to MPEG-4 format playable on your mobile phones. Choose **File > Import Video to from Internet** to begin downloading videos.

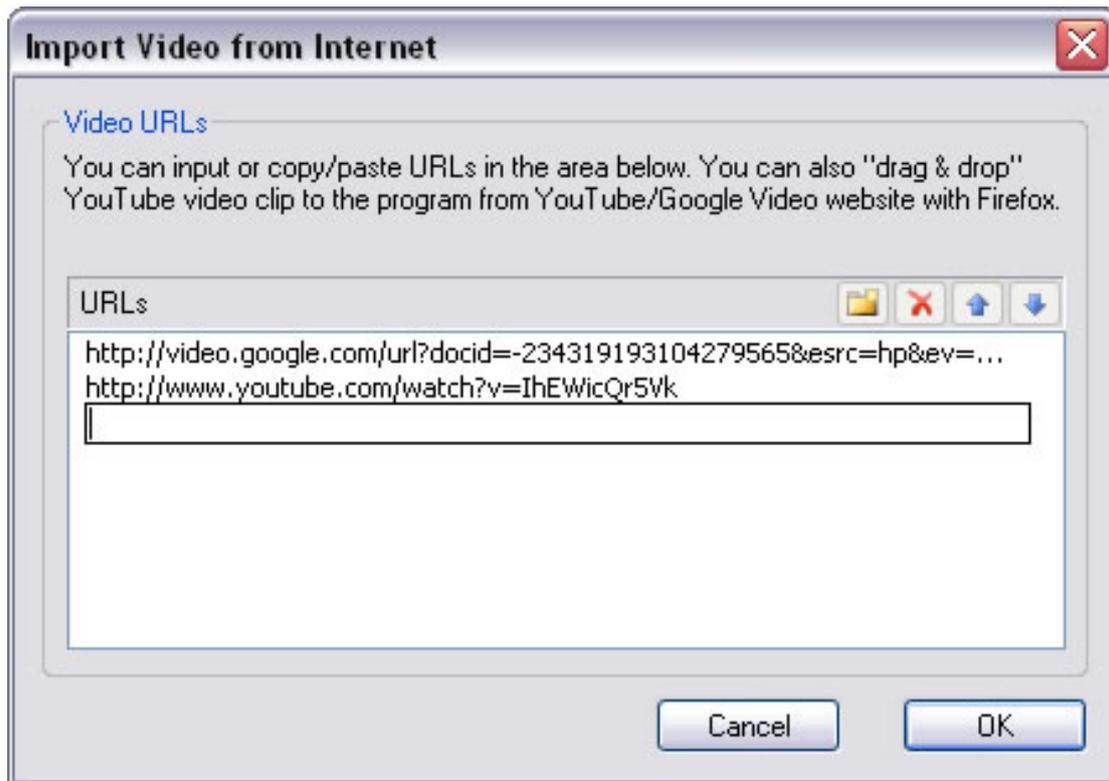

1. Copy the link locations of desired videos

If you want download videos from YouTube, click **Online Video** tab in the [Options](#) window to sign in your YouTube account. Then visit YouTube.Com and right-click on the desired video to choose **Copy Link Location** (this is for **Firefox** users) or open the video and then copy the URL from the navigation bar (this is for **IE** users).

If you want to download videos from Google, Visit video.google.com and right-click on desired video to choose Copy the Link Location.

2. Paste the link in the program

Right-click on the panel for adding videos in the program and then choose **Paste Video URL**. You can also choose **File > Import Video from YouTube** and then click **Add** button to paste the URL of the video.

3. Start to download

Double-click the pasted video URL to start downloading video from YouTube and Google.

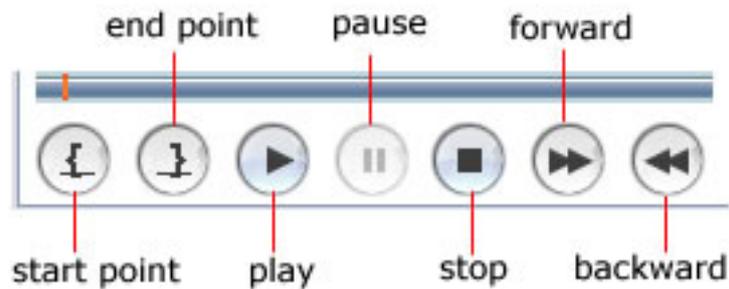

2.3 Capturing Videos from DV

The program supports capturing videos from your DV directly, but IEEE 1394 card is required to connect your DV with the PC.

1. Connect your DV with the computer. Make sure the DV is turned on and set to VCR mode.
2. Choose **File>Capture Video from DV** menu. You will see a pop-up window.
3. Click the **Start Capture** button in the pop-up window to capture the video.

3. Trimming and Viewing Videos

If you want to trim added videos, select the video in the added video list and then click **Play** button in **Preview** window. You may click **Start Point** or **End Point** to trim the video as you like.

4. Choosing Output Profile

After adding videos to the program, you can choose an output profile to convert the video to. Profiles for iPod, iPhone, PSP, Zune, DVD and cell phones are provided. You can even choose to extract the audio only from the video in MP3 format. All default technical parameters of selected profile will be displayed in the bottom right panel after you choose it.

Customizable WMV and AVI format are also available. You can change almost all settings to meet your demand.

4.1 Setting Output Parameters

With Any Video Converter, you can define all the technical parameters according to your demands. Generally, the default settings in the program can produce videos in good quality.

Except the output profile options, you can make other relevant settings such as audio volume, video parameters, in the Options window of the program. Click the **Options** button in the left bottom of the main window, you will see the Options window as the following:

There are four tabs in the Options window. In each tab, you can make different setting as follows:

General

--The output folder can also be set and open here. Click the Browse button to change the location, while click the Open button to open the output folder.

--You can choose the number of threads you use to encode the video. The more threads you use, the more CPU the program will use to convert the video.

Audio

--You can adjust the audio volume in the converted files

--AAC and MP3 parameters can also be selected according to your requirements.

Normally, the default settings are recommended to use.

Video

--You can resize the videos by only fitting its width or height.

Online Video

--You may log in your YouTube account here

--The number of retries means how many times the program to try to download the video from YouTube and Google when having download problems

--Check Use system internal cache when downloading can make the download quicker

4.2 Selecting Output Folders

After encoding, all converted videos will be saved in output folder. You can choose the directory of output folder on your computer.

You can set the output folder by following two methods:

1. Click the **Options** button. In General tab of the pop-up window, you can set the output folder by clicking the **Browse** button.
2. You can also choose **File>Set Output Folder** to specify the location of the output folder.

4.3 Settings for Cell Phones

Technical specifications may be different for different cell phones. Please visit http://cellphones.about.com/od/allcellphonespecs/Find_Your_Phones_or_a_Phone_That_You_Are_Considering_Main_Page.htm to find the specifications of your cell phone.

5. Starting Videos Encoding

Once you are done, you can click on **Encode** to start the exporting process. Your output file will be saved automatically as a folder in your directed path. If you would like to cancel encoding, please just click the **Stop** button and the encoding will be stopped.

After encoding finished, you can open the output folder to view the converted videos.

6. Opening Output Converted Videos

After encoding, you can choose **File>Open Output Folder** menu or click the

button in lower left window to open the output folder of the converted files.

You can also open the output folder with the same output profile in the left window by clicking the corresponding profile.

7. Glossary

The following are some useful technical terms you may need to refer when you set video parameters.

Video Codec: Generally, the default setting for each format has been set by the program. In our experience, the set codec works very well in terms of both quality and speed.

Video Size: This specifies the output video resolution. It is not advisable that you set this to a high resolution, as the resulting video file will be huge, and it can take too long for your audience to stream it.

Video Bitrate: The bitrate of the video specifies the amount of information stored in the video. The higher the bitrate is, the clearer the video is. This setting will usually depend on your chosen resolution, and it's best to leave it as Auto. Should you decide to make your video clearer, you can try to increase this parameter.

Video Framerate: The framerate determines how fast the video frames refreshes. For video with lots of fast moving action, you will need a higher framerate to combat jerkiness. The default value will usually suffice for most cases.

Audio Bitrate: The audio bitrate determines the amount of information stored in the audio. A higher bitrate will result in clearer audio, but comes at the expense of file size.

Audio Samplerate: The audio sample rate determines the "resolution" of the audio. The higher the sampling rate is, the clearer the audio is. However, this comes at an expense of a bigger file size.

Audio Channels: You can choose to use mono or stereo. This is set to stereo by default.
